Transactions

When an order is placed on your website:

- >> The database automatically creates a transaction and you receive an email to confirm that an order has been placed.
- >> You get an overview of all the ordered items, their due date, and all your clients' data.
- >> An invoice is created automatically based on the data of the transaction.

All this is very timesaving. The only thing that is left for you to do is print the invoice and ship the order. The transaction function gives you a summary of the orders placed. It also gives an overview of the orders you placed with your suppliers or when you planned a meeting. This function also allows you to keep track of payments made. When a customer pays its order, this is registered in the database. That way you get an exact overview of all your unsettled accounts.

Products

Add products to your online catalogue in no time. Using the DataDia database you can keep your online product list up to date. From the moment you add a new product to the list, it immediately appears in your online store. By uploading pictures and files containing additional information, you can give your producers directions and/or specifications about the making of the products. After adding a product you can have the application calculate the advised selling price, based on the price of the raw materials, packing and your desired profit margin after and before taxes. This section also has a stock management function.

DataDia

Privileges

By managing the access privileges you can determine which contacts have access to your files and data. By dividing them into different groups you can allow them to access, update and/or delete records. For instance: you can give your accountants access to your financial records, but deny their access to all your other files and data. This allows separation of functions, reducing the risk of among other things embezzlement, fraud, espionage, ...

APPLICATION PRIVILEGES

Security Groups: Administrators, Extended Users, Visitors, Representative Administrators, Sales Supervisors

Application Privileges for group "Visitors":
 Price access: Purchase Prices, Sale Prices, Shop Prices

Contacts

You can manage all your contacts with DataDia. When a new client registers on your website a new record is automatically created in your contact list. By creating links and relationships between your different contacts you can create multiple extended social networks. Using a traditional directory, anyone can have access to your most imported contacts' data. By managing your contacts with DataData you are absolutely sure that no one who is unauthorized has access to them. And since the data is stored on a web server, there is no chance that it can ever get lost or stolen.

How much does it cost?

For the cost of regular hosting services you can have a complete integrated management system. There is no limit on the number of users. You will only have extra charges if you don't use our general help files but prefer individual support instead. So the price depends on the disk space you use and the traffic you generate on our server. DataDia will charge extra fees from the moment you exceed our maximum volumes. Thus, the cost of DataDia depends on the success of your site.
